<Other Pins>

**RESET** (input)

The LC898023K reset input. A low level input resets the LC898023K.

This pin must be held low for at least 1  $\mu$ s when power is first applied.

**TEST4 to TEST0** (input)

Test inputs. These pins must be connected to ground.

**XTALCK0** (input), **XTALO** (output)

Drive these pins at 33.8688 MHz. This signal is used, without modification, as main clock for the CD-ROM encoder and decoder blocks, including the DRAM interface.

**XTALCK1** (input), **XTAL1** (output)

Main clock for the SCSI block. The LC898023K is designed so that it can operate even when the ECC and SCSI blocks are not synchronized. Providing a 20 MHz input to the XTALCK0 and XTALCK1 pins assures that correct, synchronized transfer at 10 Mbyte/s (20 Mbyte/s for Ultra SCSI) can be achieved. The maximum frequency that can be used is 20 MHz.

Since both edges of the clock signal are used by Ultra SCSI, the duty ratio must be correct. Add feedback resistors on the XTALCK1 and XTAL1 pins and take other measures as required.
